ACCESSION NR: AP5011189

Investigated beta ketones attach acetyl acetone, propionyl acetone, and di-propionyl methane, but the two molecules of diethyl hydrazine attach only acetyl acetone and propionyl methane. The infrared and nuclear magnetic resonance spectra show that the reaction products of beta ketones with two molecules of diethyl hydrazine have hydrazine-hydrazine cis-chelate structure. Orig. art. has: 2 figures and 2 tables.

Card 1/1 Pub. 89 - 18/31

Authors : Domnin, V., City of Dzerzhinsk, Gorky Region

Title : USW Radio Station UA2TZh (YA3T<sub>1</sub>H)

Periodical : Radio 11, 30-31, Nov 1954

Abstract : An USW receiving-transmitting station, built by the author (an active member of the USW section of the Dzerzhinsk radio club), is described. The set consists of a 1-V-2 type receiver with a super-generator type detector, and of a transmitter representing a generator, operating on a type G-807 tube, and a three-stage modulator. A description is given of the separate stages of the set, and the tubes used in these stages are designated. The method of operation and change from transmission to reception and vice versa, is dealt with. The structural details of the component parts, and the cabinet dimensions are listed. The USW station can be used for radio-telephone communications, for telegraph ABC-code transmission, and for recording. Circuit diagram.

AUTHORS: Kotlyarevskiy, I. L., Fisher, L. B., and Domnina, Ye. S.  
TITLE: Oxidative polycondensation of diacetylene compounds  
PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh nauk, no. 10, 1961, 1905 - 1907

TEXT: In a previous paper (Ref. 1: I. L. Kotlyarevskiy, L. B. Fisher, A. A. Dulov, A. A. Slinki, Izv. AN SSSR. Otd. khim. n. 1960, 950) the example of p-diethynyl benzene (I) showed that oligomers with conjugate aromatic and acetylene bonds can be obtained by oxidative condensation to linear diacetylene compounds. After this paper, another one describing a similar synthesis was published (Ref. 2: see below). The physical properties of the poly-p-diethynyl benzene thus synthesized are similar to those of semiconductors and ferromagnetics. In the present paper, the examination of this reaction is continued. The corresponding polymers for which, in analogy to II, the structures VII, VIII, IX, and X are suggested, were obtained by oxidative polycondensation of 1,4-diethynyl-1,4-dihydroxy-cyclohexane (III), 9,10-diethynyl-9,10-dihydroxy-9,10-dihydro

The initial p-diethynyl benzene (I) was obtained by two methods: (1) from the dehydrogenation products of p-diethyl benzene (Ref. 4: A. A. Balandin, N. I. Shuykin, G. M. Marukyan, I. I. Brusov, R. G. Seymovich, G. K. Lavrovskaya, V. K. Mikhaylovskiy, Zh. prikl. khimii, 32, No. 11; 2566, 1959), which were brominated in carbon tetrachloride at -12 - -15°C. The resulting tetrabromide was filtered off, washed with carbon tetrachloride, and recrystallized from chloroform (melting point: 156 - 157°C). Hydrogen bromide was then split off from the above tetrabromide by a method of R. Deluchat (Ref. 7: Ann. chimie 11, 1, 181 (1934)), and p-diethynyl benzene (melting point: 95°C) was thus obtained. 2) From p-diacetyl benzene by catalytic hydrogenation to 1,4-di(-1-hydroxy-ethyl)-benzene, by dehydration to p-divinyl benzene, and by bromination and further treatment of the latter as described under 1). The monomers III - V were obtained by condensation of acetylene and diketones in liquid ammonia (Ref. 5: W. Ried, H. J. Schmidt, Chem. Ber. 90, 2499 (1957)). Compound VI was obtained by aromatization of IV (Ref. 6: W. Ried, H. J. Schmidt, A. Urschel, Chem. Ber. 91, 2472 (1958)). Cuprous chloride was used as a catalyst for polycondensation, and aqueous dioxane, aqueous alcohol, and pyridine (Ref. 2: see below) were used as solvents. The

TITLE: Highly unsaturated polymers. Communication 9. Synthesis and polycondensation of diacetylenic derivatives of phenanthrene

SOURCE: AN SSSR. Izv. Seriya khimicheskaya, no. 6, 1964, 1090-1095

TOPIC TAGS: diacetylenic polymer, diacetylenic phenanthrene derivative, synthesis, polycondensation, unsaturated polymer, acetylenic oligomer, conjugated acetylenic polymer, conjugated polymer, organic semiconductor, semiconducting polymer

ABSTRACT: As a continuation of research to determine the effects of monomer structure on the physical properties of oligomers, oligomers were synthesized in which conjugation was retained or interrupted, and copolymers were synthesized in which units having interrupted conjugation alternated with conjugated units. 9,10-bis(methoxy)-9,10-diethynyl-9,10-dihydrophenanthrene (I) was made from 9,10-diethynyl-9,10-dihydroxy-9,10-dihydrophenanthrene (III) and dimethyl sulfate

ACCESSION NR: AP404116)

6

and powdered KOH; 9,10-diethynylphenanthrene (II) was made by aromatizing III. I and II were subjected to oxidative polycondensation in pyridine with catalyst amounts of cuprous chloride. Copolymers of I and III and of I and p-diethynylbenzene (IV), and of III and IV were similarly made. The IR spectra and EPR data for the products are tabulated. "Electron paramagnetic resonance spectra were obtained in the laboratory by M. V. Yoyevodsko, V. K. Yermolinyev, N. M. Gazhin and L. A. Shapovalov, whom the authors thank." TITLE: Automatic Welding of Annular Seams

PERIODICAL: Byul. tekhn.-ekon. inform Sovnarkshoz Orlovsk. ekon. adm. r-na, 1958, Nr 3, pp 15 - 17

ABSTRACT: Information is given on automated welding of hollow cylindrical work pieces made of 3.5 mm thick "30KhGSA" steel. Manual welding applied previously required the use of expensive "VI10-6 (101" electrodes and high-quality welding operators. Weld joints carried out with low labor efficiency were frequently non-fused, contained slag impurities, etc. The author present the basic electrical circuit of an automated installation which includes a PSh-5 semi-automaton, two SUG-2r welding generators and a device for rotating the work piece. Best results were obtained by automatic arc welding of the work on an extensible copper backing with preliminary heating. The circuit diagram of the installation

Automatic Welding of Annular Seams

SOV/137-59-4-8131

is given. Welding was performed under preliminarily dried AN-348A flux (at 300 - 350°C) with SV-18KhMA welding rod according to GOST standard 2246-54. Detailed technological parameters of the welding process are given. The strength of the weld joints is high and after isothermic hardening their  $\sigma_b$  attains the values of up to 110 - 145 kg/mm<sup>2</sup> and  $\delta = 12\%$ . Labor efficiency was raised 5 - 6 times.

"Virological Examination of Urban Sewage in Periods of Mass Immunization with Live Attenuated Polioviruses"

Budapest, Acta Microbiologica. Vol 9, no 3, 1962; pp 251-259.

Abstract [English article, authors' English summary]: The urban sewage of Budapest was tested for enteroviruses during the mass vaccinations executed in January and April, 1961. In January, children under 3 years of age were immunized with live type 1 poliovirus vaccine. No poliovirus could be isolated in the period beginning with the 3rd day before and ending 15 days after, the start of the vaccination campaign. The failure might be explained by the improper place of sampling and the comparatively low number of the vaccinated subjects. From two samples ECHO 1 virus was isolated. --- In April 1961, the children under 10 years of age were vaccinated (most of them revaccinated) with trivalent live poliovirus vaccine. Sewage samples were taken in three districts of Budapest. Polio-

virus vaccine. Sewage samples were taken in three districts of Budapest. Poliovirus types 2 and 3 were detectable in most of the samples taken on the end day of the campaign or thereafter, up to the end of the period of examination. --- Swab samples proved to be substantially more valuable than catch samples. Only half of the latter whereas three quarter of the former yielded virus. From swab samples twice as many virus strains were isolated than from the same number of catch samples. --- Attempts to concentrate by ion-exchange resin the virus content of sewage samples were unsuccessful. [18 references, predominantly Western].

"Epidemiological and Serological Analysis of the First Ornithosis Epidemics in Hungary"

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol 9, No 4, 1962/63; pp 369-380.

Abstract [English article; authors' English summary]: In Hungary ornithosis epidemics have occurred in poultry-processing plants in each year since 1960. The first three outbreaks have been analyzed epidemiologically and serologically. Each outbreak had two waves; 211 cases were observed altogether. The attack rates were 21.5, 17.4 and 3.6%, respectively. Outbreaks I and III occurred at the same plant with an interval of one year. The incidence was the highest in the employees having been exposed to respiratory infection. In the course of outbreaks I and II the attack rate was in no relation to the time of service at the same poultry-processing plant; outbreak III, on the other hand, affected almost exclusively those who had

1871. ISOLATION AND IDENTIFICATION OF COXSACKIE VIRUS STRAINS IN 1952-54 . 1952-54 évi Coxsacki vírus izolálási kísérletek és a kitenyész tett törzse azonosítása . *Domok I.* Országos Közegészségügyi Intézet, Budapest - EGESZSÉGTUDOMÁNY 1957, 1 (31-42) Tables 6

Strains of virus pathogenic for suckling mice were isolated from 21 out of a total of 451 specimens in 1953-54. The specimens came from different parts of Hungary. Isolation was successful in the highest proportion of cases diagnosed as summer grippé, but strains were also isolated from patients with herpangina and poliomyelitis. In one case accidental infection in a laboratory worker caused typical Bornholm disease. The majority of strains were recovered from patients about 2 yr. of age. The affections described, and the minor outbreaks, occurred mostly in summer and in early autumn, but a few sporadic cases of C infection were demonstrated in the rest of the year as well. During a nationwide poliomyelitis epidemic the frequency of C virus isolations decreased. Nineteen out of 21 strains have been identified up to now. The strains belong to 11 antigenic types, of which 3 differ from the standard types (A1-A10, B1-B4) used in the identifying experiments.

1406. STUDIES ON THE INTERACTION BETWEEN COXSACKIE AND POLIO-MYELITIS VIRUSES. II. LATE RESISTANCE TO POLIOMYELITIS OF YOUNG MICE PREVIOUSLY INFECTED WITH COXSACKIE B<sub>1</sub> VIRUS -  
Démák L. State Inst. of Hyg., Budapest - ACTA MICROBIOL. ACAD.  
SCI. HUNG. 1958, 5/1 (111-122) Graphs 4 Tables 6

It has been demonstrated that inoculation of mice 9 days of age with Coxsackie B<sub>1</sub> virus induces an enhanced resistance of long duration against the mouse-adapted Lansing strain of poliomyelitis virus. The resistance of such animals to poliomyelitis virus on the 36th and 60th days after Coxsackie B<sub>1</sub> infection was about 28 times greater than that of controls. The route of infection with Coxsackie B<sub>1</sub> virus had little or no influence on the development of the late resistance. Mice infected 36 days previously with Coxsackie B<sub>1</sub> virus were moderately resistant against EMC and LCM viruses too, but not at all against tick encephalitis virus. Humoral antibodies do not seem to play any role in the phenomenon. (L, 4)

In connection with the new Hungarian overhead line standards, an analysis was carried out of the errors caused by assuming the shape of the line conductors as parabolas. An accurate calculation was carried out using hyperbolic functions. For practical cases the error was negligible for both sag and stress.

TITLE: Concrete floors with epoxy resin coverings

SOURCE: Stroitel'nyye materialy, no. 7, 1964, 4-5

TOPIC TAGS: concrete, epoxy plastic

Abstract: The Moscow Construction Engineering Institute (MISI) imeni V. V. Kuybyshev investigated grade ED-6 epoxy resin coverings containing hardener -- dibutylphthalate; settling agent -- polyethylene glycol; filler -- ground quartz sand; pigments, and cement. Oxalic anhydride was used as settling agent during hot polymerization. Tests were conducted for wearing properties and hardness. The wear of the dissolved specimens covered with protective films based on epoxide resin is 1 1/2-2 times less in comparison with concrete specimens without the protective coverings. The absolute indexes of the wear are very close to the values of the wear of specimens made of high-strength concrete. The Brinell hardness is somewhat lower than in the specimens without coverings. Other tests showed that epoxy resin protective coverings are water-resistant and frost-resistant. Orig. has 1 table.

TITLE: Compensation of temperature errors in pressure gages [Awarded 3rd prize at the 1966 "Design and Structural Solutions" competition, sponsored by Finommechanika]

SOURCE: Finommechanika, no. 1, 1967, 25-28

TOPIC TAGS: manometer, pressure gage, pressure compensator, temperature error compensation

ABSTRACT: The study deals with theoretical computation principles of temperature errors in manometers, and with practice solutions for reducing such errors. Temperature errors are divided into categories, and the errors of the sensing element and transmission system are discussed separately. The paper gives several examples of practical solutions based on theoretical results, and describes how temperature compensation can be achieved. Using the data, temperature
